01 / START HERE

A clear routine for every bake

Plan the bake. Count what happened. Review before closing.

Keep the screen labels in English

This guide uses the exact tab and button names you will see in the app. Every worked example is fictional and must not be entered as a real record.

1 **Choose the date and Your name**
Check the selected day before entering anything. The bakery uses Maine local dates and saved times show ET. Your name identifies the person making the entry; the login is shared.

2 **Before production: Next bake**
Review Suggested and Preorders separately, adjust Planned quantity, then Save plan for each product. Opening Next bake selects tomorrow; check the date again.

3 **During the day and at close: Today & close**
Enter actual baked and leftover counts. Save progress as you go. At close, check each card and use Finish product until it shows Reviewed.

Find the right place

Next bake / Today & close	Plan tomorrow / record actual production and close.
Week plan / Products	Edit one date / maintain recurring weekly quantities and sales links.
Settings / Purchases / Review	Special dates and bake sizes / recorded invoices / reports and coverage.

Daily counting does not require purchase or supplier administration. Suggestions need staff judgment; they do not place orders or change Clover.

Use **Help & guides** to replay the tour, choose English/Español or download these guides. The tour opens on the first visit in each browser. Skip or replay it anytime; no individual staff tracking.

02 / NEXT BAKE

Review the quantity, then save

A suggestion is a starting point. A saved plan is your decision for one product and date.

1 **Read the three numbers**
Manual par is the recurring quantity. Suggested is the estimate for regular demand. Preorders are confirmed pickup quantities shown separately. Planned quantity is the full quantity you will save.

FICTIONAL EXAMPLE / One product, one selected date

Suggested	Preorders	Planned quantity
30	+ 6	36

In this example the full plan is 36, not 30. Do not add the same six pickup items a second time. Use suggestion restores the displayed proposal; it still needs Save plan.

2 **Open Why this quantity?**
Read the explanation and warnings. The usual estimate uses recent matching weekdays; when there are too few valid days it falls back to the manual quantity. Events and missing evidence can change what is usable.

3 **Adjust, explain and Save plan**
Check tray sizes and pickup orders. A change over 20% needs a Reason. In this example, 46 is more than 20% above 36, so explain it before saving. Check for Plan saved. Repeat for each product.

If pickup orders are unavailable or not linked

Do not treat the missing quantity as zero. Suggestions cannot be accepted while pickup-order data is incomplete. Confirm orders with the team; use Week plan only for a consciously reviewed manual plan.

Reload suggestions does not replace plans already saved. Review changes and save deliberately.

03 / TODAY & CLOSE

Count actual production

The plan is not an actual count. A blank field and a zero mean different things.

Blank	Not counted or not yet known. Leave unknown counts blank.
0	Counted, and there are none. Enter zero only after checking.
Actually baked	Everything actually produced for this product that day, including extra batches.
Left over	All unsold units before splitting their destination. Do not subtract TGTG, reused or discarded twice.

Enter Actually baked yourself. Confirm baked = plan is an explicit confirmation: use it only when actual production matches the plan. A pale placeholder is a hint, not a saved count.

FICTIONAL EXAMPLE / Count first, allocate second

Actually baked

40

Left over

8

Open Where did leftovers go? Enter Too Good To Go = 3, Reused = 2 and Discarded = 1. These are parts of the eight leftovers: 3 + 2 + 1 = 6. Two remain unassigned / kept; confirm their destination with the team. Left over stays 8.

Keep the counts consistent

Leftovers cannot exceed actual baked. TGTG + reused + discarded cannot exceed leftovers. Select Sold out only if none remain; Time (optional) records when it happened, if known.

04 / CLOSE & RECOVER

Finish with a reviewed record

Check the whole card, then Finish product. Saving progress alone does not mark it reviewed.

End-of-day checklist

- [ ] The selected date and Your name are correct.
- [ ] Actually baked and Left over are counted, including real zeros.
- [ ] Too Good To Go, Reused and Discarded are correct subsets of leftovers.
- [ ] Any unassigned / kept leftovers have an agreed destination.
- [ ] Sold out and the optional time match what happened.
- [ ] Each product shows Reviewed; check filters before assuming all are done.

One-tap close: only when the plan was exactly right

Baked [quantity] as planned · all sold → confirms the planned amount was actually baked, sets leftovers to zero and finishes the product as sold out. Use it only if all of that is true. Otherwise enter actual counts. It does not record an invented sell-out time.

Know what has really saved

Valid edits try to save after about 1.5 seconds without another change. Save progress saves a draft now. Wait for Saved and check for errors before leaving; Unsaved or Not saved yet is not confirmation. A later edit to a Reviewed card needs another review.

No full offline mode: a save is confirmed only by the server. If an unsaved count is offered in the same tab, Restore it, review it and save. For a failed save, keep the tab open and retry. If someone changed the record, note your counts, Reload data, compare the latest values and re-enter only what is still correct.

05 / WEEK, DEFAULTS & SPECIAL DATES

Change the right level

A plan for one day is different from the recurring quantities used on future days.

1 **Week plan**
Choose the week, then select a product quantity to edit that date. On mobile, choose the day first. Enter Planned quantity, add a Reason when required, and Save plan. A date edit does not alter recurring defaults.

Print week

Use Print week for the kitchen copy. It opens the weekly plan and the print dialog. Choose Letter, landscape and one page; inspect the preview before printing. Check the date range and remember that a printout will not update itself.

2 **Products**
A manager maintains Recurring weekly quantities for Mon-Sun. Save defaults affects dates without a saved plan; it does not replace saved plans. Check Clover product links and any Confirm with Valentina / Not linked warnings. Do not guess a match from a similar name.

3 **Settings**
Confirm Units per tray, Extra allowance and Target sell-out time with the production lead, then Save product settings. Shop defaults includes Shop closing time and recent History weeks; changes need an operational reason, not a guess.

Special dates & closures

Set Event name, From, To and Applies to. Confirm whether it affects All products, a Product family or One product. A Bake multiplier of 1 keeps the usual level; 1.3 adds 30% before the extra allowance. Closed for these products stops the selected products. Save with Add event or Save event changes.

After any setup change, return to Next bake, read Why this quantity? and review the affected date. Saved plans remain until someone deliberately changes them.

06 / PURCHASES & REVIEW

Read the record and its limits

A missing value is not a zero. An invoice is not a stock receipt or a payment confirmation.

Purchases

Read confirmed suppliers, imported invoices and Purchase price changes. On mobile, cards show Previous, Latest and Price change. Prices compare only the same supplier, SKU, unit and currency; shipping and other fees are excluded. No package-size or currency conversion is assumed.

A private register, not automatic inbox reading

The app does not read Gmail automatically yet. Managers import reviewed food, ingredient and beverage invoices through Advanced administration. Purchase administration is separate from daily counting. Negative discounts and credits need manual review. Purchases do not place orders, update ingredient stock or confirm delivery or payment.

Review

Choose Compare, Product family and Product. Check linked products, recorded open days and complete closes before comparing periods. Read **Read with these limits** and **Daily sales coverage**. Recorded, Closed and Unavailable mean different things; missing dates are not zero-sales days.

Sell-through, leftover destinations and forecast accuracy need actual measured closes. Unavailable and Forecast trend unavailable mean there is not enough usable evidence. Percent change is unavailable if the previous value is zero or missing. Reports help a discussion; they do not prove demand or recommend ingredient orders.

When something blocks you

Save is disabled	Check Your name, selected date and visible warnings. Future actual counts are unavailable.
Changed by someone else	Reload the latest record, review and retry. Use Reload latest plan or Reload settings where offered; keep your notes.
Data or session problem	Use Try again / Reload reports. If asked to refresh the session, sign in again. Tell the lead which date and product are affected; never replace missing data with zeros.
