01 / START WITH ONE PRODUCT

Learn with Plain Croissant

One product. One fictional Friday. Practice the routine before using live records.

Original reference / Valentina's CSV

Plain Croissant: 12 Monday-Thursday; 16 Friday-Sunday. These are the original recurring quantities. All other figures in this lesson are fictional, including sales, trays, orders and the event.

1 **Help & guides**
Choose English or Español. Press Start guided practice / Iniciar práctica guiada. You will click buttons and fill in fields step by step. These guides keep the app's English control names.

2 **Read the practice banner**
PRACTICE ONLY · Nothing is saved means you are in the separate practice screen. Follow the highlighted control, step by step. It uses memory only: no Clover or dashboard records are saved. Dates and figures on the real screen underneath stay unchanged.

The real workspace is connected

Outside practice, the app reads Clover's catalogue and sales through the bakery website and saves its own plans and counts. It does not change Clover inventory or website availability. Practice saves nothing.

Practice opens on the first visit in each browser. You can leave, restart or repeat it from Help & guides and download either guide. There is no individual staff tracking. For live entries, check the date and enter Your name first.

02 / NEXT BAKE

Why 20? Why change it to 26?

Plain Croissant / A fictional Friday. These are practice numbers, not a real production instruction.

1 **Click Next bake, then Why this quantity?**
The four fictional Fridays sold 14, 16, 18 and 16: their average is 16. With no extra allowance and fictional trays of 6, round 16 up to 18. That is Suggested. Add 2 confirmed fictional Preorders: the full plan starts at 20.

SIMULATED / Average 16; practice allowance 0; fictional trays of 6

Suggested	Preorders	Planned quantity
18	+ 2	20

2 **Enter 26 in Planned quantity**
A fictional local event needs six more pieces. Changing 20 to 26 adds 30%. That is over 20%, so type Local event in Reason. Do not add the same two preorders again: they were already in 20.

3 **Click Save plan**
The practice now shows a saved plan of 26 for that Friday. Only the simulator changed. You have decided how many to prepare; you have not yet confirmed that 26 were actually baked.

Before saving a real plan

Check the date, Your name, trays and confirmed Preorders. Orders belong to the pickup date and are counted once across the website and orders sheet: do not add them again. Payments for later pickups are excluded from the daily suggestion. If a recommendation is blocked or a product/order is missing, ask the manager; never assume zero. Week plan remains available for a deliberately reviewed manual plan. Save each product.

03 / TODAY & CLOSE

Now count what really happened

Plain Croissant / The same fictional Friday. The saved plan is 26; actual production still needs confirmation.

1 **Click Today & close**
Keep the same lesson day. Find Plain Croissant. In practice we actually baked all 26, so enter 26 in Actually baked. A plan or pale placeholder is not an actual count.

2 **Count the unsold pieces**
There are 4 left. Enter 4 in Left over. This is the full leftover count before you split its destination. The next page will allocate those same four pieces.

SIMULATED / Plain Croissant / Same Friday

Actually baked	Left over
26	4

Blank	Not counted or unknown. Do not invent a zero.
0	Counted, and there are none. It is an actual observation.
Confirm baked = plan	Only use it when actual production really matched the plan.

Saving progress in the real workspace

Valid edits try to save after about 1.5 seconds without another change. Save progress saves a draft now; it does not finish the product. Wait for Saved and check errors. No full offline mode: a real save is confirmed only by the server. Practice controls save only inside the exercise.

04 / CLOSE THE PRODUCT

Four leftovers, three destinations

Plain Croissant / Same Friday: 26 baked and 4 left. Keep the whole count, then explain where it went.

1 **Open Where did leftovers go?**
Enter Too Good To Go = 2, Reused = 1 and Discarded = 1. They are parts of the four leftovers: 2 + 1 + 1 = 4. Left over stays 4. Discarded waste is only 1, not 4.

SIMULATED / All 4 leftovers are assigned; none are counted twice

Too Good To Go	Reused	Discarded
2	1	1

2 **Leave Sold out unselected**
Four pieces remained, so this product did not sell out. Do not add a sell-out time. In a real close, record Time (optional) only when Sold out is true and the time is known.

3 **Click Finish product and check Reviewed**
The lesson close is complete. In the real workspace, do this for every product after checking the date, Your name, actual counts and destinations. Check filters before assuming the whole day is finished.

Do not use the all-sold shortcut in this example

Baked [quantity] as planned · all sold → means the plan was actually baked and nothing remained. Our four leftovers make it wrong here. For a real close, leftovers cannot exceed baked; their destinations cannot exceed leftovers. Confirm any unassigned / kept pieces with the team.

Checklist for a real close

- [ ] Date, Your name and actual baked / leftover counts are correct.
- [ ] Leftover destinations fit; Sold out matches what happened.
- [ ] Every product shows Reviewed; filters have been checked.

05 / WEEK PLAN

A different Friday, a different plan

Plain Croissant / Move to Friday of the following week. Do not overwrite the Friday you just closed.

1 **Click Week plan, then next Friday's 16**
This is a future date in another week. Its starting quantity is the original recurring Friday default: 16. Today's reviewed practice close stays at 26 baked and 4 left.

2 **Enter 18 and click Save plan**
Only that next Friday becomes 18 in the simulator. You changed one date, not the weekly default. In the real Week plan, check the selected week and day before doing the same kind of edit.

Original CSV reference	Mon-Thu: 12. Fri-Sun: 16. Recurring defaults stay unchanged.
Lesson Friday	Plan 26; actual baked 26; leftovers 4; Reviewed.
Following Friday	One simulated saved plan: 18 instead of 16.

Where the other controls fit

Products maintains recurring quantities and daily sales links. Thanksgiving and other campaign orders need separately confirmed production links; do not link their campaign items to daily sales. Ask the manager when an order is pending. Settings maintains trays, extra allowance, shop hours, events and closures. The lesson's tray of 6 and event are fictional: do not copy them. A manager confirms changes. Print week: choose Letter, landscape and inspect the kitchen plan.

A starting point, not the whole old workbook

The starting quantities came from a CSV extracted from Valentina's Excel. The planning method follows the Claude specification. This does not reproduce every old spreadsheet calculation. Annual history, freezer stock and dough planning are still pending.

06 / REVIEW & PURCHASES

Read the result without guessing

Plain Croissant / Return to the fictional Friday: 26 baked, 22 simulated sales and 4 leftovers.

SIMULATED RESULTS / 4 leftovers = 2 TGTG + 1 reused + 1 discarded

Simulated sales	Actually baked	Left over
22	26	4

Click Review. In this lesson, 26 - 22 = 4 explains the story. **The real app does not calculate sales by subtracting leftovers.** It reads recorded sales from Clover through the website. Discarded is 1; the other three leftovers went to TGTG or reuse. There was no sell-out.

Real Review: check the evidence first

Choose period and product. Sales comparisons use the payment date, which may differ from pickup and production. Check Read with these limits and Daily sales coverage. Unavailable is not zero. For plans with pickup orders, forecast accuracy stays unavailable until demand is measured on comparable pickup dates, even with completed closes. Production and waste need actual counts. Do not compare an advance payment directly with that day's bake.

Purchases

Plain Croissant also needs ingredients, but an invoice is not a stock count. Purchases is a private register of manually verified food, ingredient and beverage invoices. It does not read Gmail automatically, place orders, confirm delivery/payment or update ingredient stock. Compare prices only for the same supplier, SKU, unit and currency; fees are separate. Negative credits need review.

A real save fails	Keep your entries and retry. Check Your name, the date and errors. Restore may recover an unsaved count in the same tab; it still needs review and a confirmed save.
Someone changed it	Keep notes. Reload the latest record, compare and retry: Reload latest plan / Reload settings where offered. Never replace missing data with zeros.
